AI-NATIVE DELIVERY / DATA PLATFORMS / PROGRAM LEADERSHIP

Sean Newman

AI-native Technical Program Manager

Turning complex AI and data initiatives into measurable business outcomes.

Enterprise AI, public-sector services, data modernization, and hands-on AI-assisted product development.

LEADERSHIP GROUNDED IN CLARITY

From requirements to delivery.

I bridge engineering teams and business stakeholders to define clear requirements, align priorities, and deliver complex technical programs.

As an AI-native TPM, I use GitHub Copilot and connected tools to take products from idea to cloud deployment. I pair hands-on AI fluency with empathy and program leadership across enterprise AI and data initiatives.

HOW I LEAD

01 Clarify the problem

Translate domain expertise and stakeholder needs into actionable technical requirements.

02 Align the team

Coordinate engineers, business groups, and non-technical stakeholders around a shared delivery plan.

03 Build for lasting value

Prioritize measurable outcomes, responsible AI practices, and scalable platforms.

ENTERPRISE AI / LEGAL OPERATIONS

AI-powered legal request triage

Role: Technical Program Manager | Engineering team: 12

83%

Less manual processing time

6 hours to 1 hour

Per request, during data entry and validation in triage.

THE CHALLENGE

A leading Seattle-based technology company received hundreds of legal demands daily. Manual extraction and validation consumed substantial specialist time.

MY CONTRIBUTION

01 Defined a cloud-native architecture

Designed a resilient foundation for an AI component within the client's Dynamics environment.

02 Led engineering and requirements

Led 12 engineers and translated legal specialists' workflows into technical specifications for GPT-4o vision extraction and validation.

SOLUTION FLOW

Legal demand > **AI extraction + validation** > **Specialist review**

PUBLIC SECTOR / CONVERSATIONAL AI

Faster access to nutrition assistance

Role: Technical Program Manager | Engineering team: 5

+25%

User satisfaction

30 min

Time to get assistance

Previously 1-3 days

THE CHALLENGE

A US state government faced thousands of website visitors seeking nutritional aid guidance, with too few staff to respond promptly.

MY CONTRIBUTION

01 Designed and delivered the agent

Architected an AI search and GPT-4o solution, then led five engineers to build it with responsible AI practices and content filters.

02 Validated with policy specialists

Ran user acceptance testing to assess response accuracy, gather feedback, and address hallucinations.

SOLUTION FLOW

Citizen question > **AI search + chat agent** > **Relevant policy guidance**

ENTERPRISE DATA / PLATFORM MODERNIZATION

A unified foundation for business analytics

Role: Technical Program Manager | Engineering team: 2-6

5

Business groups

One shared source of truth

Unified reporting across previously siloed data warehouses.

THE CHALLENGE

A Fortune 500 technology company had disparate data warehouses across its organization, limiting consistent cross-business analytics.

MY CONTRIBUTION

01 Established the migration plan

Planned the move to a unified platform and led 2-6 engineers through documentation, design, and migration.

02 Aligned five business groups

Standardized migration execution with key stakeholders and incorporated industry-standard data practices for long-term scalability.

THE OUTCOME

Established a single source of truth for accurate leadership reporting and cross-business analysis.

INDEPENDENT PROJECT / AI-NATIVE PRODUCT DEVELOPMENT

Tennis scheduler: idea to working product

Role: Product owner & builder

~10 hours

To create and refine the app

End-to-end with AI

Built across a few weekends, including cloud deployment.

THE CHALLENGE

Build a working match-scheduling app for my tennis team to limit test how far AI development tools could take a small product end to end.

HOW I USED THE AI HARNESS

01 Owned the product; directed AI execution

Used GitHub Copilot throughout development and refinement, with a native connection to the project's GitHub repository.

02 Used Auto mode; escalated selectively

Kept model selection in Auto for almost all development. Switched to a specific model twice when progress stalled.

03 Connected development to cloud delivery

Integrated the Azure plugin through the app marketplace. Copilot handled all cloud deployment work through that integration.

EXPERIENCE AT A GLANCE

Built on delivery. Focused on impact.

Technical program leadership across AI and data initiatives.

10+
Solutions delivered

2-12
Engineers across featured teams

2-3
Concurrent client portfolios

4+
Stakeholder time zones
